Continuation of 11. does NOT place the application in condition for allowance because: In response to the applicant's argument that the signature disclosed by McCarroll is not a certificate according to the invention since it cannot be executed, the examiner respectfully points out that the portion of the software code for the game that is digitally signed is being read on the executable certificate and not the accompanying signature file containing a digest that corresponds to an unmodified portion of software code for the game that is digitally signed.

In response to the applicant's argument that McCarroll performs a mathematical comparison and not a positive comparison as defined in the specification, the examiner respectfully points out that a positive comparison is defined as "any action, operation or modification on the data used by the software application to be verified or any action, operation or modification on the running of the execution of the software application to be verified produces a behavior of the software application to be verified identical to that which is expected by the running of the execution of the authentic application." See applicant's specification page 2 lines 18-23. The examiner now points out that hashing a portion of software code into a first message digest is any action, operation or modification, the first message digest is a behavior of the portion of software code, and a second message digest from the signature file is that which is expected by running the execution of the authentic application. See McCarroll paragraph 30. Accordingly, the digest comparison performed by McCarroll fits within the definition of positive comparison defined in the applicant's specification.

In response to the applicant's argument that McCarroll contains a tamperproof circuit for cryptographic operation whereas the certificate of the invention is executed on the host terminal itself, the examiner respectfully points out that the tamperproof circuit for cryptographic operations is contained in the host terminal. See McCarroll fig.1 ref. nos. 100 and 120. The examiner further points out that the claim language recites the transitional phrase "comprising," and therefore is inclusive or open-ended and does not exclude additional, unrecited elements or method steps. See MPEP 2111.03

In response to the applicant's argument that a signature is decrypted before the application is executed, the examiner respectfully disagrees with the applicant's position. The examiner respectfully points out that the execution of the software code for a game begins with the boot process and reading the software code from the game disc. The decryption of a signature occurs during this boot process and therefore the decryption of a signature is a step contained with the execution of the software code for game.
